Assignment: Flexbox Navigation Bar

Week: 6	**Due:** Sunday, Oct 4, 2026 by 11:59pm
Points: 2 points	**Submit:** ZIP file (HTML + CSS)

Assignment Overview

Build a page with a professional navigation bar and a row of cards, both laid out with Flexbox. This is about controlling layout on purpose instead of fighting the browser. Media queries come next week, your layout should adapt using Flexbox alone.

What to Build

A single landing page for any subject you like. It needs a header with navigation at the top, a short intro section, and a row of at least three cards below.

Your page must include

- **A semantic `<nav>`** containing a `<ul>` of links, laid out with display: flex
- **A brand or logo on one side** and the links on the other, spaced with justify-content and vertically aligned with align-items
- **gap for spacing** between nav items, not margin hacks on each `<li>`
- **flex-wrap on the nav** so the links wrap neatly instead of overflowing when the window gets narrow
- **A sticky header** using position: sticky, so the nav stays visible while scrolling (add enough content to actually scroll)
- **A row of 3 or more cards** as a second flex container, using flex-wrap and gap
- **Clean typography and color** carried over from last week: an external styles.css, readable type, and a restrained palette

What to Submit

A ZIP file named **`LastName_Navbar.zip`** (example: Kraishan_Navbar.zip)

Containing index.html and styles.css, plus images/ if you used any. Before you submit, drag your browser window narrow and wide to check that nothing overflows or overlaps.

Grading (2 points)

Criteria	Points	What I'm Looking For
Flexbox Navigation	**0.6**	A working flex nav with purposeful justify-content, align-items, and gap. Brand and links positioned deliberately.
Card Row & Wrapping	**0.5**	Three or more cards in a second flex container that wrap cleanly at narrow widths instead of overflowing.
Positioning & Flow	**0.4**	A sticky header that works while scrolling, and a page that holds together without broken or overlapping elements.
Type, Color & Code Quality	**0.5**	External stylesheet, readable type and palette, semantic HTML, and clean organized CSS.

Tips & Common Mistakes

- display: flex goes on the container, not on the items. Putting it on each `<li>` is the #1 mistake here.
- Kill the default list look first: list-style: none and padding: 0 on the `<ul>`.
- Use gap for space between flex items. It is cleaner than margins and does not leave a stray edge.
- flex-wrap: wrap is what keeps your layout from breaking at narrow widths this week.
- You do not need media queries yet, and floats are legacy. Flexbox handles all of this.
- You will not be graded on hover effects, but adding a simple :hover and :focus on links is good practice.
