Assignment: Responsive Card Grid Gallery

Week: 7	**Due:** Wed, Oct 11, 2026 by 11:59pm
Points: 2 points	**Submit:** ZIP file (HTML, CSS, images)

Assignment Overview

Build a responsive photo or project gallery using CSS Grid. Your grid must adapt across three sizes: one column on mobile, two on tablet, three or four on desktop. Use Grid for this, not Flexbox.

What to Build

Pick a theme with 8 to 12 items: a photography portfolio, a travel list, a movie or book collection, recipes, or your own design projects. Each card needs an image, a heading, and a one or two sentence description.

Your page must include

- **8 to 12 cards** in semantic HTML: `<figure>`, `<h2>` or `<h3>`, and `<p>`
- **A grid container** using display: grid and grid-template-columns with repeat()
- **gap** for the spacing between cards, instead of margins on each card
- **At least one more Grid property:** grid-auto-rows, grid-template-areas, grid-column, or align-items
- **Three layouts, mobile first:** 1 column by default, 2 columns at min-width 768px, and 3 to 4 columns at min-width 1024px
- **The viewport meta tag** in your `<head>`, or your media queries will not work on a real phone
- **rem or em for type and spacing,** avoiding fixed px where you can, plus a consistent card design and cohesive palette

What to Submit

A ZIP file named **`LastName_Gallery.zip`** (example: Kraishan_Gallery.zip)

Containing index.html, styles.css, and an images/ folder. Resize your browser narrow to wide and confirm all three layouts work before submitting.

Grading (2 points)

Criteria	Points	What I'm Looking For
CSS Grid Implementation	**0.7**	Correct use of Grid, not Flexbox. Four or more Grid properties used purposefully, with equal-height cards.
Responsive Breakpoints	**0.6**	Three distinct working layouts at mobile, tablet, and desktop widths, with no horizontal scrolling.
Relative Units	**0.3**	rem or em for type and spacing, with minimal reliance on fixed px values.
Design & Code Quality	**0.4**	Consistent cards, cohesive palette, semantic HTML, and clean organized CSS.

Tips & Common Mistakes

- Use Grid, not Flexbox. Building this with Flexbox is the biggest point loss on this assignment.
- Forgetting the viewport meta tag is the #2 loss. Without it, your phone ignores your breakpoints.
- grid-template-columns: repeat(3, 1fr) gives three equal columns, where 1fr is one share of the free space.
- Start at mobile with one column, then add min-width media queries. Building desktop first makes this much harder.
- 1rem equals 16px by default. Grid gives equal-height cards for free, do not force heights, and keep image aspect ratios similar.
